

Acunetix Website Audit
9 January, 2018

# **Developer Report**

# Scan of http://172.16.200.236:8080/web

#### Scan details

Scan information	
Starttime	9/01/2018 8:45:47 AM
Finish time	9/01/2018 11:02:19 AM
Scan time	2 hours, 16 minutes
Profile	Default

Server information	
Responsive	True
Server banner	Apache/2.4.23 (Win64) PHP/5.6.26
Server OS	Unknown
Server technologies	PHP

#### **Threat level**

#### **Acunetix Threat Level 3**

One or more high-severity type vulnerabilities have been discovered by the scanner. A malicious user can exploit these vulnerabilities and compromise the backend database and/or deface your website.

#### Alerts distribution

# Knowledge base

#### List of file extensions

File extensions can provide information on what technologies are being used on this website. List of file extensions detected:

- ds\_store => 26 file(s)
- css => 51 file(s)

# Alert details

# Cross Site Scripting (verified)

Severity	High
Туре	Validation
Reported by module	Scripting (XSS.script)

#### Description

This script is possibly vulnerable to Cross Site Scripting (XSS) attacks.

Cross site scripting (also referred to as XSS) is a vulnerability that allows an attacker to send malicious code (usually in the form of Javascript) to another user. Because a browser cannot know if the script should be trusted or not, it will execute the script in the user context allowing the attacker to access any cookies or session tokens retained by the browser.

#### **Impact**

Malicious users may inject JavaScript, VBScript, ActiveX, HTML or Flash into a vulnerable application to fool a user in order to gather data from them. An attacker can steal the session cookie and take over the account, impersonating the user. It is also possible to modify the content of the page presented to the user.

#### Recommendation

Your script should filter metacharacters from user input.

# SQL injection

Severity	High
Туре	Validation
Reported by module	Scripting (Sql_Injection.script)

# Description

This script is possibly vulnerable to SQL Injection attacks.

SQL injection is a vulnerability that allows an attacker to alter backend SQL statements by manipulating the user input. An SQL injection occurs when web applications accept user input that is directly placed into a SQL statement and doesn't properly filter out dangerous characters.

This is one of the most common application layer attacks currently being used on the Internet. Despite the fact that it is relatively easy to protect against, there is a large number of web applications vulnerable.

## **Impact**

An attacker may execute arbitrary SQL statements on the vulnerable system. This may compromise the integrity of your database and/or expose sensitive information.

Depending on the back-end database in use, SQL injection vulnerabilities lead to varying levels of data/system access for the attacker. It may be possible to not only manipulate existing queries, but to UNION in arbitrary data, use subselects, or append additional queries. In some cases, it may be possible to read in or write out to files, or to execute shell commands on the underlying operating system.

Certain SQL Servers such as Microsoft SQL Server contain stored and extended procedures (database server functions). If an attacker can obtain access to these procedures it may be possible to compromise the entire machine.

# Recommendation

Your script should filter metacharacters from user input.

Check detailed information for more information about fixing this vulnerability.

# 🕕 We

# **Weak Password**

Severity	High
Туре	Informational
Reported by module	Scripting (Html_Authentication_Audit.script)

# Description

Manual confirmation is required for this alert.

This page is using a weak password. Acunetix WVS was able to guess the credentials required to access this page. A weak password is short, common, a system default, or something that could be rapidly guessed by executing a brute force attack using a subset of all possible passwords, such as words in the dictionary, proper names, words based on the user name or common variations on these themes.

# **Impact**

An attacker may access the contents of the password-protected page.

## Recommendation

Enforce a strong password policy. Don't permit weak passwords or passwords based on dictionary words.

## References

# Application error message

Severity	Medium
Туре	Validation
Reported by module	Scripting (Error_Message.script)

# Description

This page contains an error/warning message that may disclose sensitive information. The message can also contain the location of the file that produced the unhandled exception.

This may be a false positive if the error message is found in documentation pages.

## **Impact**

The error messages may disclose sensitive information. This information can be used to launch further attacks.

# Recommendation

Review the source code for this script.

# PHPinfo page found

Severity	Medium
Туре	Validation
Reported by module	Scripting (Text_Search.script)

#### Description

This script is using phpinfo() function. This function outputs a large amount of information about the current state of PHP. This includes information about PHP compilation options and extensions, the PHP version, server information and environment (if compiled as a module), the PHP environment, OS version information, paths, master and local values of configuration options, HTTP headers, and the PHP License.

#### **Impact**

This file may expose sensitive information that may help an malicious user to prepare more advanced attacks.

#### Recommendation

Remove the file from production systems.

#### References

## Login page password-guessing attack

Severity	Low
Туре	Validation
Reported by module	Scripting (Html_Authentication_Audit.script)

#### Description

A common threat web developers face is a password-guessing attack known as a brute force attack. A brute-force attack is an attempt to discover a password by systematically trying every possible combination of letters, numbers, and symbols until you discover the one correct combination that works.

This login page doesn't have any protection against password-guessing attacks (brute force attacks). It's recommended to implement some type of account lockout after a defined number of incorrect password attempts. Consult Web references for more information about fixing this problem.

#### **Impact**

An attacker may attempt to discover a weak password by systematically trying every possible combination of letters, numbers, and symbols until it discovers the one correct combination that works.

#### Recommendation

It's recommended to implement some type of account lockout after a defined number of incorrect password attempts.

#### References

**Blocking Brute Force Attacks** 

#### Affected items

# OPTIONS method is enabled

Severity	Low
Туре	Validation
Reported by module	Scripting (Options_Server_Method.script)

#### Description

HTTP OPTIONS method is enabled on this web server. The OPTIONS method provides a list of the methods that are supported by the web server, it represents a request for information about the communication options available on the request/response chain identified by the Request-URI.

#### **Impact**

The OPTIONS method may expose sensitive information that may help an malicious user to prepare more advanced attacks.

#### Recommendation

It's recommended to disable OPTIONS Method on the web server.

#### References

# Possible sensitive directories

Severity	Low
Туре	Validation
Reported by module	Scripting (Possible_Sensitive_Directories.script)

#### Description

A possible sensitive directory has been found. This directory is not directly linked from the website. This check looks for common sensitive resources like backup directories, database dumps, administration pages, temporary directories. Each one of these directories could help an attacker to learn more about his target.

#### **Impact**

This directory may expose sensitive information that could help a malicious user to prepare more advanced attacks.

#### Recommendation

Restrict access to this directory or remove it from the website.

# Possible sensitive files

Severity	Low
Туре	Validation
Reported by module	Scripting (Possible_Sensitive_Files.script)

#### Description

A possible sensitive file has been found. This file is not directly linked from the website. This check looks for common sensitive resources like password files, configuration files, log files, include files, statistics data, database dumps. Each one of these files could help an attacker to learn more about his target.

#### **Impact**

This file may expose sensitive information that could help a malicious user to prepare more advanced attacks.

#### Recommendation

Restrict access to this file or remove it from the website.

#### References

# User credentials are sent in clear text

Severity	Low
Туре	Informational
Reported by module	Crawler

### Description

User credentials are not encrypted when they are transmitted.

### **Impact**

A third party may be able to read the user credentials by intercepting an unencrypted HTTP connection.

#### Recommendation

Because user credentials usually are considered sensitive information, it is recommended to be sent to the server over an encrypted connection.

#### Affected items

### /apps/home/auth/login

#### **Details**

It seems that user credentials are sent to /apps/home/auth/checklogin in clear text.

### Request headers

GET /apps/home/auth/login HTTP/1.1

Pragma: no-cache

Referer: http://172.16.200.236:8080/apps/

# Broken links

Severity	Informational
Туре	Informational
Reported by module	Crawler

### Description

A broken link refers to any link that should take you to a document, image or webpage, that actually results in an error. This page was linked from the website but it is inaccessible.

#### **Impact**

Problems navigating the site.

#### Recommendation

Remove the links to this file or make it accessible.

#### Affected items

### /a

# Content type is not specified

Severity	Informational
Туре	Informational
Reported by module	Crawler

### Description

This page doesn't set a Content-Type header value. This value informs the browser what kind of data to expect. If this header is missing, the browser may incorrectly handle the data. This could lead to security problems.

#### **Impact**

None

#### Recommendation

Set a Content-Type header value for this page.

### Affected items

### /apps/.gitignore

#### **Details**

HTTP/1.1 200 OK

# Email address found

Severity	Informational
Туре	Informational
Reported by module	Scripting (Text_Search.script)

### Description

One or more email addresses have been found on this page. The majority of spam comes from email addresses harvested off the internet. The spam-bots (also known as email harvesters and email extractors) are programs that scour the internet looking for email addresses on any website they come across. Spambot programs look for strings like myname@mydomain.com and then record any addresses found.

#### **Impact**

Email addresses posted on Web sites may attract spam.

### Recommendation

Check references for details on how to solve this problem.

# GHDB: Default phpinfo page

Severity	Informational
Туре	Informational
Reported by module	GHDB

## Description

The description for this alert is contributed by the GHDB community, it may contain inappropriate language. Category: Files containing passwords

This will look throught default phpinfo pages for ones that have a default mysql password.

The Google Hacking Database (GHDB) appears courtesy of the Google Hacking community.

### **Impact**

Not available. Check description.

### Recommendation

Not available. Check description.

### References

The Google Hacking Database (GHDB) community
Acunetix Google hacking

### Affected items

## /info.php

### **Details**

We found intitle: "phpinfo()" +"mysql.default\_password" +"Zend Scripting Language Engine"

## Request headers

## Description

The description for this alert is contributed by the GHDB community, it may contain inappropriate language. Category: Files containing juicy info

this brings up sites with phpinfo(). There is SO much cool stuff in here that you just have to check one out for yourself! I mean full blown system versioning, SSL version, sendmail version and path, ftp, LDAP, SQL info, Apache mods, Apache env vars, \*sigh\* the list goes on and on! Thanks "joe!" =)

## 0 Pa

## Password type input with autocomplete enabled

Severity	Informational
Туре	Informational
Reported by module	Crawler

## Description

When a new name and password is entered in a form and the form is submitted, the browser asks if the password should be saved. Thereafter when the form is displayed, the name and password are filled in automatically or are completed as the name is entered. An attacker with local access could obtain the cleartext password from the browser cache.

### **Impact**

Possible sensitive information disclosure

### Recommendation

The password autocomplete should be disabled in sensitive applications.

To disable autocomplete, you may use a code similar to:

<INPUT TYPE="password" AUTOCOMPLETE="off">

### Affected items

# Possible username or password disclosure

Severity	Informational
Туре	Informational
Reported by module	Scripting (Text_Search.script)

### Description

A username and/or password was found in this file. This information could be sensitive.

This alert may be a false positive, manual confirmation is required.

### **Impact**

Possible sensitive information disclosure.

### Recommendation

Remove this file from your website or change its permissions to remove access.

#### Affected items

# /apps/assets/css/icons.css
